/clone_limage_num_melanotic melanoma"
/tlssue_type="melanotic melanoma"
/lab_host="bH10B (phege-resistant)"
/note="Organ: skin; Vector: poTB7; site_1: xhoI; site_2:
EcoRI; cDNA made by oligo-dT priming. Directionally
cloned into EcoRI/RhoI sites using the following 5'
adaptor: GGCACGAG(G). Size-selected >500bp for average
insert size 1.8kb. Library constructed by Ling Hong in
the laboratory of Gerald M. Rubin (University of
California, Berkeley) using ZAP-CDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies)."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes the isolation of a novel human B1 protein which can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, oligonucleotides and ribozymes can also be used to regulate the above cancer treating AIDS, 90pp; English for 3B; Fig 4 pathways Claim

C77607 to C78448 encode the human cancer associated proteins given in B43398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antinheumatic; antiarthritic; antinflammatory; antiasthmatic; antiherdic; antibacterial; antiviral; dermatological; antiapterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coaqulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and conditions and diagnosing pathological conditions. Polynucleotides, polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            medical

The sequences were isolated from cDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, immune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antagonists are useful for treating or preventing disorders associated

This intention describes and CARD-4 polynucleotides and proteins and a partial murine CARD-4L protein and genes. The genes and proteins of partial murine CARD-4L protein and genes. The genes and proteins of caspase activation.

The invention are involved in the requiation of caspase activation.

The caspase recruitment domain (CARD) polynucleotides, polypeptides, homologues and antibodies can be used in screening assays, detection assays, predictive medicine and therapeutic and prophylactic methods of treatment. The methods may be used to diagnose and treat patients which are suffering from a disorder associated with abnormal level or rate of apoptotic cell death, abnormal activity of the TMF receptor complex, abnormal activity of the TMF receptor complex, abnormal activity of a caspase. Diseases that may be treated include cancer (particularly follicular lymphoma, carcinomas associated with mutations at cityity of a caspase. Diseases that may be treated include cancer (particularly follicular lymphoma, carcinomas associated with mutations in p33 and hormone-dependent tumours), autoimmune disorders (e.g. systemic lupus erythematosis, immune-mediated dolomerulonephritis), viral captemic lupus erythematosis, immune-mediated dolomerulonephritis), viral infections, Alzheimer's disease, parkinson's disease, amyotrophic lateral captering and stroke. CARD-3 protein interacts with other cellular proteins, and so can be used for regulation of cellular proliferation and differentiation and captering and stroke. CARD-3 protein interacts with other cellular proteins, and so concompounds which modulate their activity. The CARD-4 qene can express a concompounds which modulate their activity. The CARD-4 qene can express a concompounds which modulate their activity and CARD-4 qene can express a long transcript that encodes CARD-4t, a short transcript that encodes CARD-4t, a short transcript that encodes capted to the capted capted to the capted capted to the capted capted to the capted capted capted capted capted capted capted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or two CARD-4 splice variants, CARD-4Y and CARD-4Z. This sequence the human CARD-3 protein described in the method of the
spinal muscular dystrophy; cerebellar degeneration; anaemia; drug; myelodysplastic syndrome; myocardial infarction; cell proliferation; cell differentiation; cell survival; CARD-4L; CARD-4S; CARD-4Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel CARD-3 and CARD-4 genes and polypeptides used or treating regulation of cellular proliferation and differentiation and cell survival

Sequences F21614 - F22031 represent DNA sequences encoding human proteins B58711 - B59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences F22032 - F22040 and B59129 which are used in the isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive, nootropic; antiinflammatory; antiuleer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune hyroiditis, diabetes multiple sclerosis, rheumatoid arthritis and ulcerative colitis; contrological disorders such as myocardial ischaemats, wound healing; contrological
                                                                                                                                                                                                                                                                                                              New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases such as cerebral anoxia and epilepsy; and

The invention provides polynucleotides which encode novel protein kinase homologs expressed in various human cells and tissues. The present sequence represents the clone 156108 cDNs fragment derived from a human cDNs library designated THP-1 phorbol LPS. The cDNs encodes a protein kinase which shows homology to the U01064 Dictyostelium Y kinase. Vectors and host cells can be used for recombinant production of the protein kinase homology. The recombinant proteins may be used to raise antibodies for use as anti-kinase therapeutics. Oligonucleotides based on the polynucleotide sequences, i.e. probes and antisense constructs, the petidies and antibodies are claimed to be useful as tools for studying signalling cascades in cells and proteins, and for identifying inhibitors (drugs) to treat diseases and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               conditions associated with abnormal kinase expression. Diseases that are claimed to be treatable include human X-linked agammaglobulinaemia, nonspherocytic haemolytic anaemia, artherosclerosis, carcinomas, diabetes, gliomas, restenosis, cholera-based septic shock, etc.
                                                                                                                                                                                                                                                                                                                                   Protein kinase; cell signalling; inflammation; carcinoma; diabetes; human X-linked agammaqibulinaemia; nonspherocytic haemolytic anaemia; artherosclerosis; glioma; restenosis; cholera-based septic shock; U01064 Dictyostelium Y kinase; ss.

Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate anglogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Zel606-Ze1832 represent CDNA sequences derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      several mouse, rat or human skin cell types. Sequences 261606 261699, 261725-261765, 261802-261811 and 261826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences 261660-261668, 261766-261780, 261812-261817 and 261827-261829 encode proteins with one or more putative transmembrane domains.

                                                                                                                                                                                                                                                                                                                                   The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV) 1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of

The present sequence encodes a murine death associated kinase protein, containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides can be used to express the polypeptides, and as probes to identify nucleic acids encoding proteins having kinase activity. DAKAR polypeptides and fragmented polypeptides are used for purifying proteins, e.g. to measure protein activity; as quality assurance agents proteins, e.g. to measure protein expired protein protein; as quality of adentify novel molecules involved in signal transduction pathways, and to identify therapeutic compounds which may interfere with apoptosis; as molecular weight and isoelectric focusing markers; as controls for peptide fragmentation; identification of unknown proteins, e.g. up comparison with proteins in databases; and for preparation of antibodies. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity chromatography. The antibodies can also be used to block binding of the DAKAR polypeptides to their binding partners. Compounds that inhibit or enhance the kinase activity of DAKAR can be used to treat diseases

The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying calls. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences 261606-261802 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences 261606-261649, 261755-261765, 261802-261811 and 261826 encode proteins with an sequence, indicating that the proteins are secreted. Sequences 261650-261668, 261766-261180, 261812-261817 and 261812-261817 encode proteins with one or more putative transmembrane domains. oligonucleotides for examining expression patterns.

5.

```
The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Murison JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A single-stranded DNA (or its complementary strand or the corresp. Codouble-stranded DNA) which comprises one of the 7837 "6S" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA is repeted courately the relative abundance of is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for

The present sequence is that of Genesis clone 971025TRAM004820HT

(Fel) DNA. The translation of the clone (frame 3) is provided in

(TY9154. The polypeptide has kinase activity. The invention

relates to purified murine polypeptides (see Y79152-56) that

have kinase function and isolated nucleic acids encoding them (see

CS 55828-86). The nucleic acids can be used to express the

polypeptides, as probes to identify nucleic acids encoding proteins

having kinase activity, and in assays to identify chromosomes, map

murine genes, and study tumours. Vectors comprising the novel

cn uncleic acids and host cells (bacterial, yeast, plant, insect or

animal) transfected or transduced with the vectors are claimed.

The kinase polypeptides and their fragments are used as mol.wt. and

fragmentation many also have a number of thermanity uses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    330 tgagocgocgoctotggcactgtgtcgtccgcccgccacgcagactggcgcgtccagg 389

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The CTRI gene was mapped to an interval between 2 RFLPs in chromosome 5 of A. thaliana and a chromosome walk in this area was initiated using a YAC library, 2 clones were isolated and used to probe a cDNA library derived from polyA RNA from 3 day-old dark-grown, ethylene-treated A. thaliana seedlings. The cDNA for the CTRI gene is given in Q98816. Expression of the CTRI gene in transgenic plants results in a dominant ethylene-insensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New constitutive triple response genes and mutants - isolated from Arabidopsis thaliana, used to produce transgenic plants with improved properties

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                  1 MNGEAICSALPTIPYHKLAD......PEILVVSRSPSLNLLQNKSM 540
